The Labrador Retriever is one of the most intelligent breeds of dog, however, Labrador Retriever training isn't always as easy as you want it to be. Just like when training other dog breeds, training a smart Labrador Retriever can be extremely challenging if not frustrating. You must be equipped not only with the right knowledge but with appropriate training instruments as well to get impressive outcome.

In the internet, you can get several tips that can help you get that well-trained Labrador Retriever you have been dreaming about. But not all those ideas are applicable to all pets all the time. In some cases, a particular method might not be as effective to you as it is to your neighbor who also owns a Labrador. Below are the tips you certainly do not want to ignore:

Evaluate Your Dog's Capacities

The Labrador Retriever is commonly healthy and intelligent breed - features that contribute to achieving successful Labrador Retriever training. But even if they are of the same breed, each dog is different from the other thus you shouldn't expect that your pet is capable of doing whatever the other dog can do. It would be best to assess your dog's potential first instead of expecting desirable results too quickly. Is he healthy enough to endure strenuous activities? Can his stomach tolerate homemade training treats? By figuring out such information, you'll determine what areas to focus on and what are the things to avoid.

Establish A Routine

Dogs cannot understand English, or any other human language for that matter. The only method for them to learn is through routine. By taking your dog to the area you designated as his toilet and rewarding him whenever he urinates or defecates there, he will eventually figure out what you want him to complete. The same principle should be applied when teaching commands sit, down, come and many others. But be sure that you;

Stay Consistent

Considering that dogs learn through routine, it is of utmost importance to be consistent with your methods to prevent confusion. For basic obedience training, use a specific word or phrase for every command. If you're using the command "sit" to train your four-legged friend to sit, do so

consistently to prevent causing confusion.

Avoid Setting High Expectations

Expecting too much too early is one certain way towards frustration. The Labrador Retriever is an intelligent breed but not all successful Labrador Retriever training can be accomplished in a single day. Sometimes, it may take days for a pet to perfect a specific command. Patience, coupled with determination should be applied rather than expect too much.

Never Use Physical Punishment To Correct Your Pet

Physical punishment is not the most effective solution to modify your pet's bad behavior. In fact, it will do more harm than good since the action can potentially induce trauma to your precious pet.
